PlaylistParty

Startup 05 Report

Key React Components:

- *mainDashboard.js*
 - Contains subcomponents: *mainbody.js*, *navbar.js*, and *sidebar.js* which also have nested components within them. This component renders the main page of the application.
- *mainDashboardMusic.js*
 - This contains the same subcomponents as *mainDashboard.js*, but it has an added *musicplayer.js* component. We plan on merging these two components that way we can dynamically click on a song to bring up the music player on the main dashboard without having to render a different html page.
- *createPlaylist.js*
 - This is a modal which we plan to have render on top of the mainDashboard instead of on its own html page. It does not contain any subcomponents.
- *accountSettings.js*
 - This is a modal which we plan to have render on top of the mainDashboard instead of on its own html page. It also does not contain any subcomponents.
- *accountOverview.js*
 - This contains all of the same subcomponents as *mainDashboard.js* but instead of *mainbody.js* it uses its own *mainbodyaccount.js*, which replaces the table in our mainDashboard page.
- *searchResults.js*
 - This is a modal which we plan to have render on top of the mainDashboard instead of on its own html page. It also currently does not contain any subcomponents. We are planning on separating it into several subcomponents.

Founder Contribution:

- *Jon Bailey*
 - Worked with Sam McGuire to make the mainDashboard and mainDashboardMusic functional.
- *Sam McGuire*
 - Worked with Jon Bailey to make the mainDashboard and mainDashboardMusic functional.
- *Dominick Carnevale*
 - Provided functionality to Create Playlist.
- *Michelle Ko*
 - Worked on Search Results.
- *Nick Cummings*
 - Provided functionality to Account Settings and Account Overview.
- *Jake Magier*
 - No notable contributions.

Known bugs/Future developments

- We plan on taking all of the pages that are modals (Account Settings, Create Playlist, Search Results) and making a generic modal component to be rendered on top of the MainDashboard to consolidate html pages.
- Need to work with search results once we start using the actual Spotify API because we are not sure how that data is going to be accessed until we start working with an actual database.

Commit hash to look at for this startup: 42b1bce
